# References

Nine sources in IEEE style, each with a working DOI or stable URL. Every one is cited in the technical report, and the five that carry the argument appear on the closing slide of the presentation.

# Note on primary sources

The dataset reference [1] and its accompanying paper [2] are the primary sources for every dataset figure in this work. Where the released documentation and an internal project note disagreed, the released documentation and the stored arrays governed. The two conventional-method references [3] and [6] and the two learning references [4] and [5] are cited for method and for context, not for numbers that appear in this report; no result here is compared against a published score on a different dataset.
